

Today we have finished the initial tests of Switchfin running on IP01/IP01p hardware targets. A successful SIP - DAHDI call was made. The update has been commit in the [Switchfin trunk](#)

IP01/IP01p is working well driven by Astfin 2.0 software why should we bother upgrading to Switchfin?

Well Switchfin provides series of advantages and new features. Some of those listed below

- New Linux kernel 2.6.28
- New Asterisk 1.4.28
- DAHDI driver replaces Zaptel
- UBIFS file system replaces the old YAFFS
- spandsp 0.0.6
- Various of new packages like SSMTP, N2N, ATFTP, VIM, etc.

The current status of the Switchfin for IP01 is **beta** and is not recommended for production environments.

The GUI is something which needs to be finalized.

Beta testers are invited.

Have fun!
Dimitar
